

## DATA-1.1 | Insert User table

### Card:

*As a developer I want to add users entries in the user table so that the Main user can use the users they created for sessions*

### Conversation:

\*This is assuming that user table has been created

This is a simple insert method that adds one user to the user table. The data validation is performed elsewhere. So the data that is passed to the "insertUser" method has already been validated.

\*\*Special case for the Main user: The main user (or the person who bought the device and is running the app on their phone; will always be userID 1 - if userID 1 is deleted then something went wrong)

\*\*\*If you work on this story you volunteer for the special user story

### Confirmation:

Can a passed user be inserted in the user table? 

The first screenshot is of the session activity where the "Add User" button is being clicked. For the testing purposes of this story all values are hardcoded and the output will be displayed using the "Currently no session started" TextView as the other parts of the app have not yet been implemented.

We are only testing and confirming the functionality of inserting a 'user' object in the database and retrieving all users.

The user being added has the following definition:

```
new User(23, "Smith", "John", 23, "Pale");
```

We are expecting to see all fields match except that userID should be 1.

From the second screen-grab it can be concluded that the insertUser() method performs as intended.

Plus all the DoD 

## Session Activity

Currently no session started

Add User

Edit User

Start session

## Session Activity

[User{UserID=1, surname='Smith',  
name='John', age=23, skinTone='Pale'}]

Add User

Edit User

Start session
